

**SIGGRAPH2011**

# Dynamica Toolset

# Dynamica History

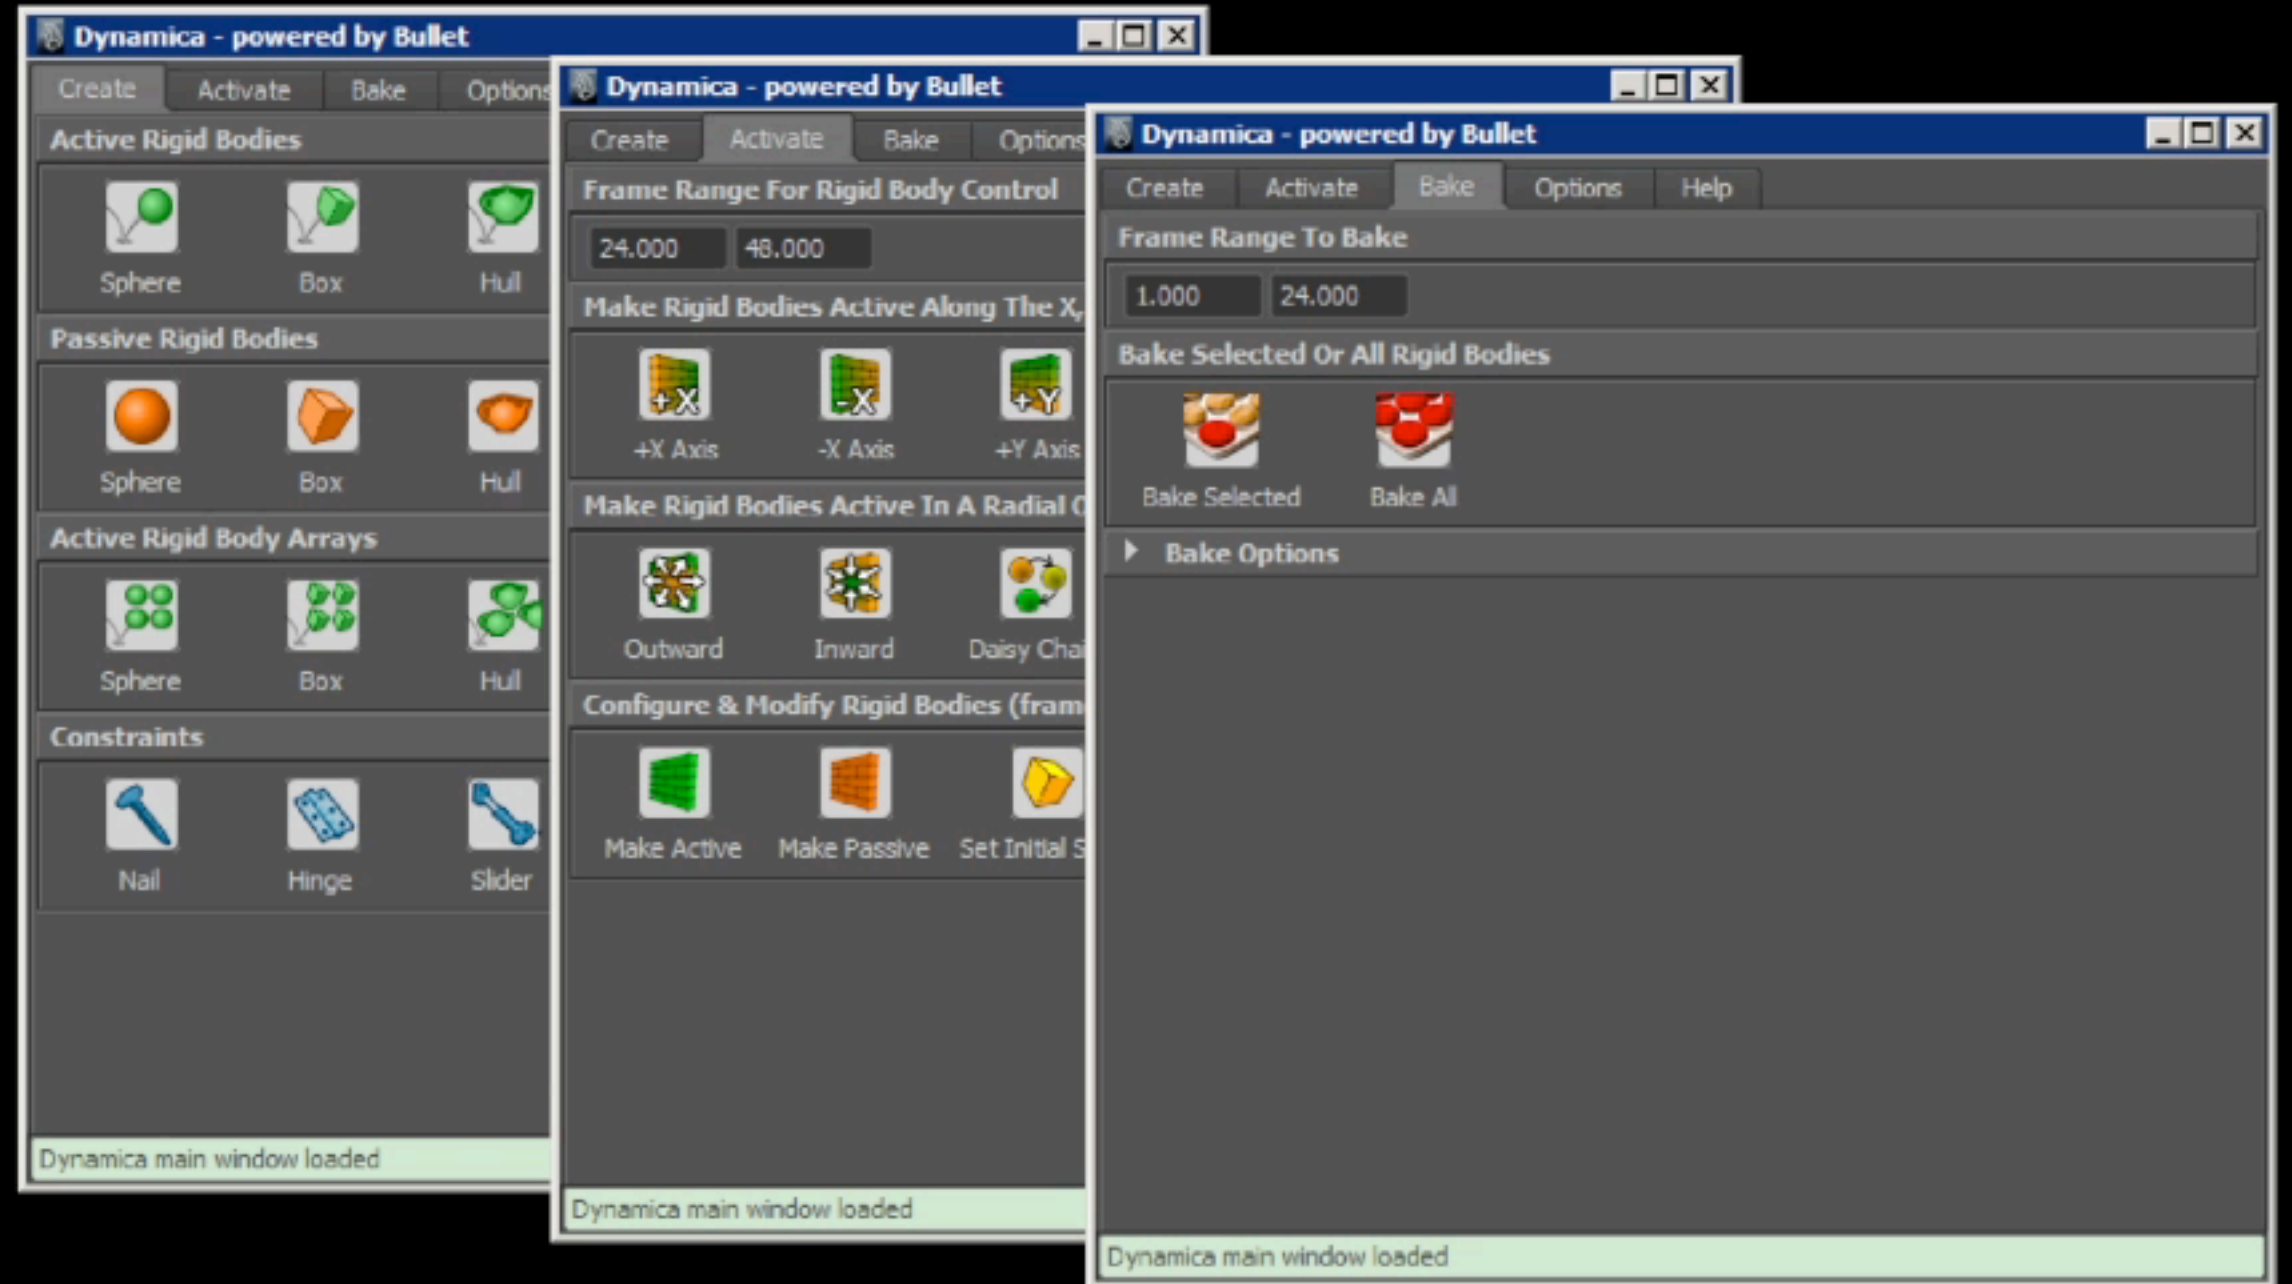

- ✦ Developed by Nicola Candussi for Disney Animation Studios
- ✦ Used in production of the animated feature *Bolt*
- ✦ Bullet Physics powered rigid body array simulation
- ✦ Donated to Bullet Physics project - thanks Disney!

# Dynamica Today (1)

- ✦ Rigid body creation, activation, and baking tools
- ✦ Voronoi pre-shatter
- ✦ Rigid body primitives, hulls, & meshes.
- ✦ Force breakable constraints & keyframed kinematic colliders

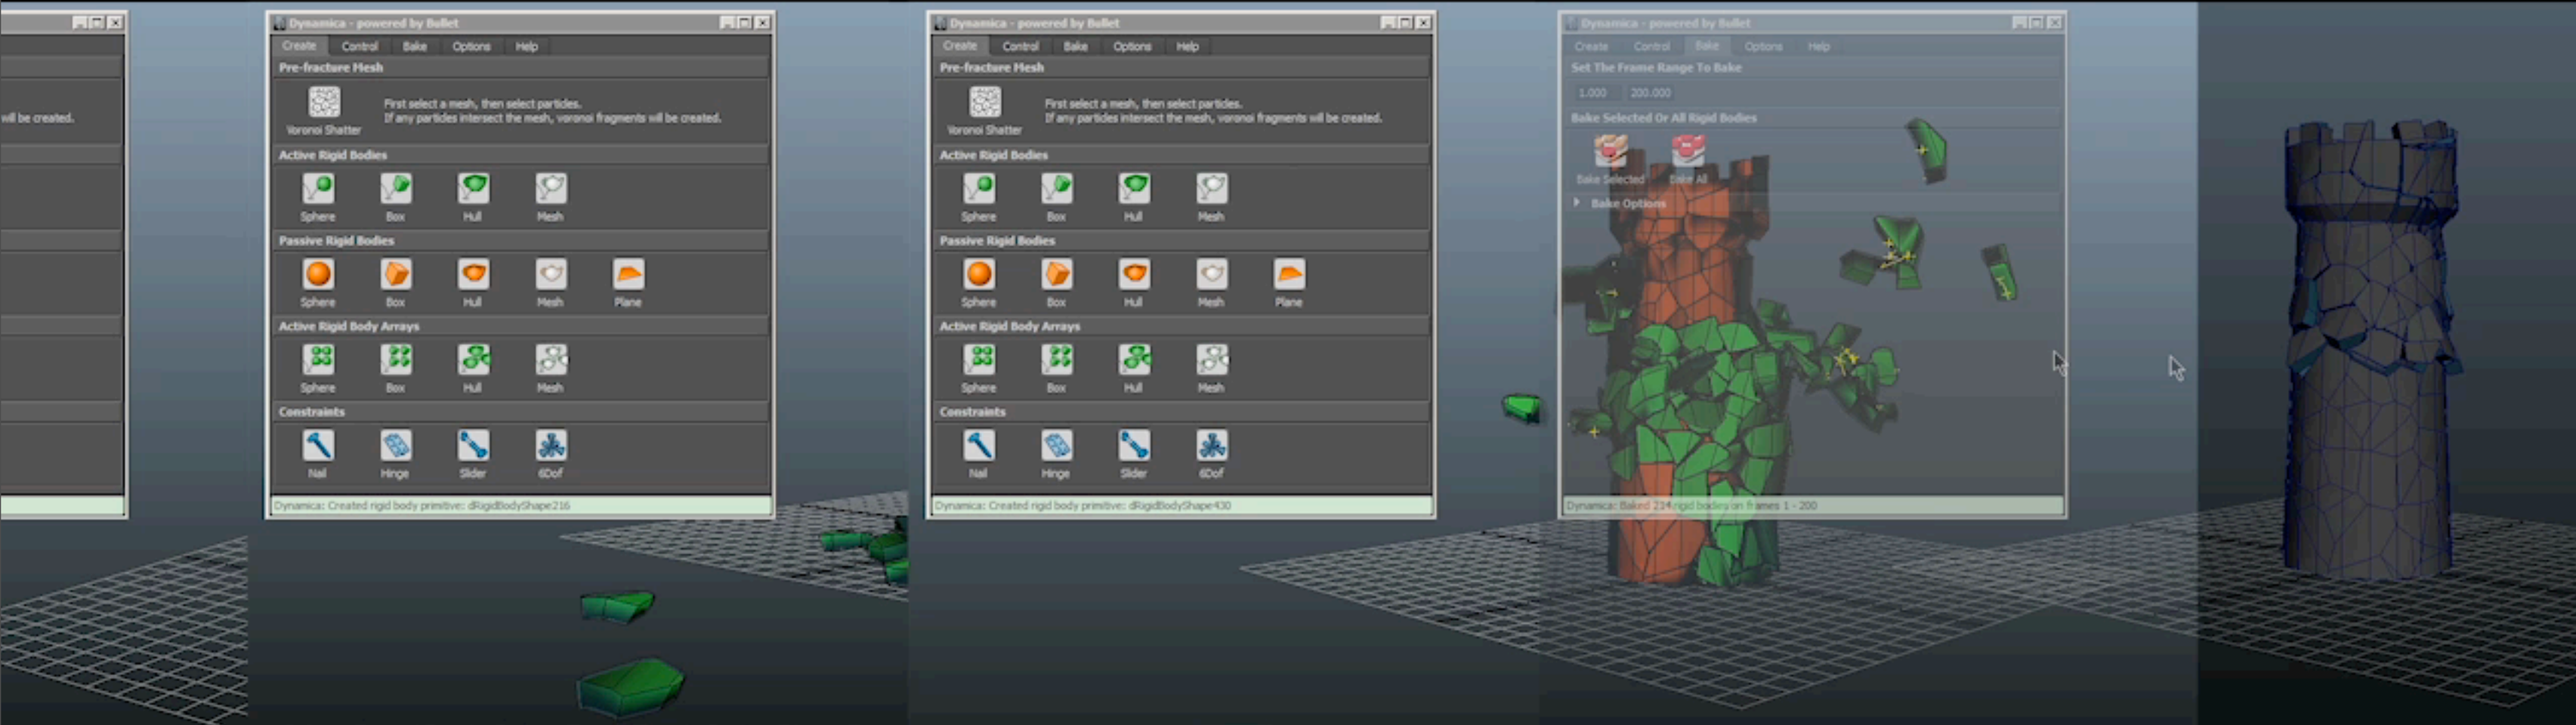

# Dynamica Today (2)

- Axis, Radial, & Daisy Chain activation controls
- Baking & pipeline integration
- Options: timestep, substep, collision margin, & constrained body collisions
- .bullet export

# Authoring Destruction : Typical Workflow

# Authoring Destruction : 3 Steps

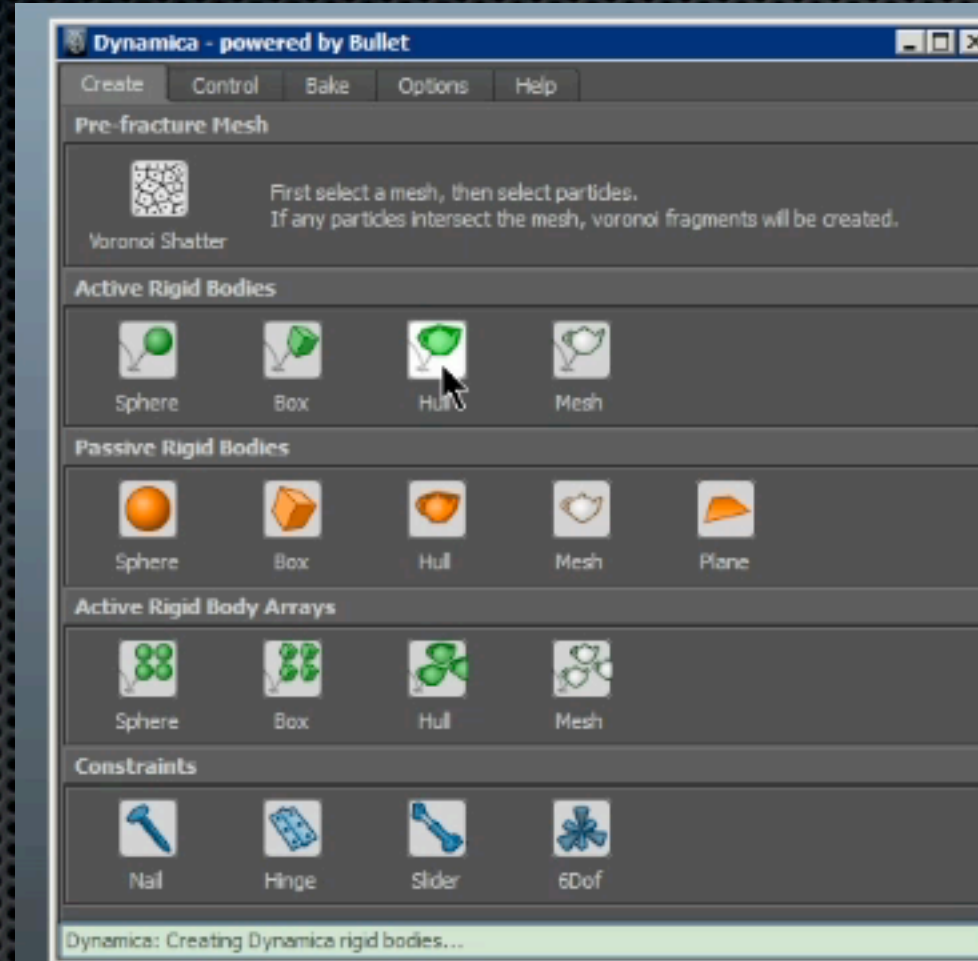

1. Mesh prep, pre-shatter & rigid body creation
2. Constrain & choreograph
3. Simulation baking & pipeline integration

# Step 1 : Mesh Preparation & Pre-shatter

- ✦ Create simple proxy shapes with conformed surface normals
- ✦ Run Voronoi shatter
- ✦ Convert to active rigid bodies
- ✦ Simulate to verify collisions

# Step 2 : Constrain & Choreograph

- ✦ Initial choreography & activation timing
- ✦ Add constraints & configure breaking thresholds
- ✦ Iterate: continue to simulate & adjust as needed

# Step 3 : Bake & Integrate

- Bake simulation as keyframe data
- Verify results
- Push down pipeline or re-integrate

# Content Created With Dynamica

# Siggraph Logo Crumble

- Voronoi pre-shattered polygon box
- Daisy Chain activation
- No constraints
- Passive rigid body box acts as “pusher”

# Castle Tower Collapse

- Rigid bodies are activated in stages along the Y axis
- Constraints hold the top together
- Particles were added after baking
- Meshes repurposed as Nucleus passive colliders

# Exploding Barrel of Apples

- Barrel held together with constraints
- Explosions controlled with intersecting passives
- Constraint breaking thresholds control disintegration

# Anti-gravity Axles

- Simple proxy shapes built to match render meshes
- Breakable hinge constraints on each wheel
- Multiple Maya fields creative anti-gravity effect

# Weapon Test

- Each block was Voronoi pre-shattered
- Explosions controlled with intersecting passives
- Particles were added after baking
- Fractured shapes were re-proxied for fluid collisions
